Chemical analysis of resin

Statistical analysis was performed with SPSS 20. Compared with the pure EP coating, its anti-corrosion efficiency is as high as 92.

Thermal conductivity and anti

The first setup was designed to analyze the force transmission under the constant weight.

Thermal conductivity and anti

In some studies in robotics and materials science, artificial skins have been used to sense not only objects but also environmental conditions like temperature, humidity, etc. Note: You are now also subscribed to the subject areas of this publication and will receive updates in the daily or weekly email digests if turned on.

Paint Testing Lab

Further studies should be carried out to evaluate the long-term reliability of the rootsurface coating materials under the clinical setting. The precise test should be performed soon for confirmation. In the materials and methods section, a detailed description of the two different chemical compounds is presented.

[Durability of protective effect of resin

Both types of materials were chosen, specifically for their different thickness values.
