Weather Instruments

The future of atmospheric research will undoubtedly involve all of the many instruments which I have discussed. Lidar Ground-based lidar observations of the volcanic ash Lidar English: LIDAR or LiDAR, LADAR, is a technology for measuring distance and remotely obtaining information about object in a distance.

History of Meteorology and Invention of Weather Instruments

Earlier ones include and As shown in the picture of the aneroid barometer, this instrument relies on a sealed, flexible unit which contains air at a fixed volume. We will also briefly allude to more modern developments.

History of meteorology and invention of weather instruments

A simple all-sky camera can be made by photographing the image seen in a highly polished metal sphere with a radius of typically 15-30 cm. They weren't invented until the 1840s—years after Franklin's time. Atmospheric humidity was also able to be measured when the hygrometer was invented in 1644.

Meteorological instrumentation

Not many copies printed, they used to sell for a couple of hundred dollars. Ancient Greece saw the first attempts to document a manual of weather forecasting. Because it is smooth and metallic, it can be tracked by radar from the ground, and by following the motion of this object the upper level winds can be determined.

Meteorological instrumentation

Sometimes radiosondes are dropped from aircraft. This type of elementary wind measuring device can still be found for sale with cheap back-yard weather kits. Some more sensitive instruments rely on other features related to pressure.
