Risk associated with the adoption of new maize technology and the impact of mandatory cotton production on traditional farmers in the Kasai Oriental Region of Zaire are evaluated within a portfolio context using a quadratic programming model.

Fourth, we find that an additional expected moisture stress period during the growing season reduces the probability that a liquidity-constrained household is a net seller by 16 percent. Other regional and local policies have served to restrict interregional trade. SEVEN7 BUSINESS See things in the present, even if they are in the future.

Maize production and marketing in four districts of Zaire : an introductory economic analysis

These results suggest that market access and competitiveness in output market in Zambia may not be as poor as is often assumed in literature. Process, Analysis, Data and Reach; all strategic elements to start a successful campaign.

Risk analysis of new maize technology in Zaire: a portfolio approach

The study also indicates that the effectiveness of the marketing system in providing incentives for maize production has been limited by weak transportation and communication links between production and consumption centers and by efforts of some traders to gain oligopsonistic power in their relations with maize producers in the more isolated areas. . One such constraint is the inability to invest in productivity enhancing agricultural inputs such as inorganic fertilizer and improved seed due to lack of liquidity i.

Smallholder Maize Market Participation and Choice of Marketing Channel in the Presence of Liquidity Constraints: Evidence from Zambia

Although we are not able to establish causality in this relationship, it appears that because liquidity constrained households are not able to adequately invest in productivity-enhancing inputs, this limits their capacity to produce a marketable surplus, thereby decreasing their probability of being a net seller of maize. Further research is needed to explore policies that can reduce liquidity constraints at time of planting and incorporate

mechanisms for productivity enhancement as a measure for encouraging commercial agriculture. The results indicate that cropping systems including new maize technology are first-order stochastic dominant in both seasons, over cropping systems using local maize.

New maize technology in Zaire: An application of risk analysis

Seasonal net returns for farm plans including four levels of maize technology in combination with staple food crops are evaluated, with and without mandatory cotton production.

Graduate Thesis Or Dissertation

Third, we find that measures of market access based on the distance from the household or village to the nearest agricultural market or main district town boma do not have a large effect on the probability of being a net seller, for either liquidity-constrained or unconstrained households. The risk associated with new maize technology and the impact of mandatory cotton production on traditional farmers in the Kasai Oriental Region of Zaire were evaluated using stochastic dominance analysis. This highlights the vulnerability of smallholder maize production in Zambia to drought and the potential benefit of the adoption of soil management practices and drought-tolerant maize varieties that can help to mitigate the negative effects of drought on crop productivity Ajayi et al 2007; Haggblade, Tembo, and Donovan 2004.

Maize Marketing

We find that more than half of all smallholders in the sample were liquidity constrained in 2012 and 2015.
