The Hawaiian Honeycreepers: Drepanidinae

Using a dataset of one mitochondrial and 13 nuclear genes, the authors were able to resolve their relationships and demonstrate their origin. Three different rainfall scenarios were simulated for the annual mean temperature of 17°C at Cooper : 1 average site-specific annual rainfall of approximately 3000 mm, 2 lower annual rainfall of 2000 mm, and 3 higher annual rainfall of 4000 mm. Exotics such as pigs create wallows in which mosquitoes thrive.

Hawaiian Honeycreeper lineage Drpanidini

Weir BS, Cockerham CC: Estimating F-statistics for the analysis of population structure.

Genetic structure along an elevational gradient in Hawaiian honeycreepers reveals contrasting evolutionary responses to avian malaria

To model the effect of malaria-tolerant Amakihi, we assumed all Amakihi in the initial simulated population had the lower disease mortality rates found in low-elevation birds C. Only a feather or two was taken, so the birds were often released if the bird was too small to eat. Therefore, that information is unavailable for most Encyclopedia.

Hawaiian Honeycreepers (Drepanididae)

Because these Amakihi are malaria-tolerant compared to conspecifics at other elevations, they are more likely to survive infection, creating a larger number of chronically infected birds which serve as a reservoir for malaria transmission to other susceptible honeycreepers. We've had the good fortune to visit the highlands of the Big Island of Hawaii with Jack Jeffrey, the premier photographer of the Hawaiian honeycreepers right, a 1989 photo of him showing us a flowering 'ohi'a tree.
