Association Between Antibiotic Use and Neonatal Mortality and Morbidities in Very Low

Infection Control and Hospital Epidemiology 1999;20:247—78. The potential future utility of antidepressant drugs for postsurgical pain also requires the recognition of potential drug interactions with opioids and other drugs commonly used in the perioperative period. Likewise, since alterations in blood pressure may contribute to the development of bleeding complications, an effort was made to control for this potentially confounding variable by calculating MAP for all patients at four distinct time points i.
