Climate and Weather Patterns This word document was downloaded from the website

Note the westward dip of Q2s and the difference in elevation between both sides of the valley for Q2s and the apparent absence of Q3s on the eastern side.

Interpretation of the rupture history of a low slip

Investigations along the BR scarp were funded by the SAFE project of the European Commission EVG1-2000-22005 , the Swiss Federal Institute of Technology ETHZ , the Swiss National Fund and the HSK Swiss Federal Nuclear Safety Inspectorate.

Influences of pre

Low-shake faults of the Ventura Basin, California, in Neotectonics in Southern California, J. Geology of the Pleasant Green Hill quadrangle, Kentucky, by W. Southwest Parks and Monuments Association, Tucson, Arizona, pp.

Factors affecting the recognition of faults exposed in exploratory trenches

Prescribed burning as a management tool for Sky Island bioregion wetlands with reference to the management of the endangered Orchid *Spiranthes delitescens*. Establishment of range grasses on various seedbeds at creosotebush *Larrea tridentata* sites in Arizona, U. The faulting episode presumably stopped during the late Oligocene and became a major west-dipping normal fault zone affecting the eastern rim of the tabular Jura.

Late Quaternary strike

However, original geomorphology with uplifted terraces and sources of recent sedimentation along the fault scarp were the main criteria for palaeoseismic site selection and. Sedimentological conditions combined with the successive movements on the fault allowed the recording of past seismic events. Three main types of fault movements associated with a faulting event are primary, secondary, and sympathetic movements.
