Aminoglycoside modifying enzymes

For the past two decades we have generated a huge amount of data that has vastly exceeded our capacity to interpret and to make use of the resulting information. Through it, the plasmid DNA is transferred from the donor to the recipient cell. An obvious solution to this problem would be the development of new aminoglycosides, a strategy that is being pursued using numerous approaches , ;.

Consequently, tensegrity in the biological systems implies the existence of networks that would influence gene expression, leading to cascades of protein signalling. Since a step in the uptake process requires functional respiration, the spectrum of action of aminoglycosides is limited to aerobic bacteria.
