Dealing with Dirty Bombs: Plain Facts, Practical Solutions

Building an effective national emergency response system could facilitate all these actions. Target cells for leukaemia may be concentrated towards the centre of marrow cavities so that the risk of leukaemia from bone-seeking radionuclides, particularly alpha emitters, may be overestimated by the current assumption of uniform distribution of target cells throughout red bone marrow. Given the widespread availability of radioactive material, deception, hoaxes, and blackmail may also occur.

Patient dosimetry measurement methods

Although Zubaydah's statements are unconfirmed, they appear to dovetail with evidence reportedly seized by U.

National Radiological Protection Board

Here the NRPB agree that the phenomena of non-lethal weapons exists because they say that with a frequency of 8 waves per second into the brain, animals can be made to go to sleep, or be stimulated at higher frequencies. To me this simple statement by the NRPB verifies the non-lethal weapons programme as sound. The reality is that the threat of a dirty bomb attack by terrorists is a credible one, although the psychological and economic consequences would likely far outweigh any casualties or physical destruction.

Radiation

In another scenario developed by the Center for Counterproliferation Research and the Defense Threat Reduction Agency, detonation of a device consisting of 100 kilograms of C4, 50 grams of Cesium-137, and 2 kilograms of plutonium in a San Diego convention center was estimated to have killed 31 and caused up to 1,969 additional fatalities and sickened 6,569.
