An assessment of the global impact of 21st century land use change on soil erosion

Comparison of measured and modelled erosion rates. But regardless, a new picture of deforestation is emerging that is very different from the conventional image of forest loss as a one-way street. For processing the main model components, the spatiotemporal variations of the land cover and management C-factor as well as the rainfall erosivity R-factor factors were assessed through new methodologies exclusively designed for this study while the K, LS and P-factor were derived from methods reported in literature Supplementary Methods.

CBF's 2020 State of the Bay Score Down Slightly

In this respect, the new global soil erosion assessment presented in this paper has the potential to become a reference input for integrating later C fluxes into large-scale model frameworks of different complexity. Investing in sustainable forest management as a strategic means for covid-19 recovery While the forestry sector is not immune to the adverse impacts of the pandemic, forests have a huge potential to contribute to COVID-19 recovery. The hardwood forests, with their abundance of sugar maple trees, are spread over roughly 17 degrees of latitude from south to north.

Conflicting Data: How Fast Is the World Losing its Forests?

In the tropics, however, the picture is more mixed. But while the GFW does not suffer from political interference, critics such as Holmgren say it has a potentially even bigger blind spot. In the future, economic growth as well as rural to urban migration is expected to continue, but demographic scenarios indicate that the population of China will peak and subsequently decline.

UN/DESA Policy Brief #88: Financing sustainable forest management: a key component of sustainable COVID

In the United States, China, Australia, Canada, Russia and several other countries, the FRA shows forests gains while the GFW shows big losses,.

UN/DESA Policy Brief #88: Financing sustainable forest management: a key component of sustainable COVID

The grey colour indicates the areas that were not modelled no data Continental and country-specific perspectives on soil erosion Our modelling results suggest that water erosion is a common phenomenon under all climatic conditions encompassing all observed continents. They committed to review and, as needed in accordance with national legislation, policies and priorities, improve forest-related legislation, strengthen forest law enforcement and promote good governance at all levels in order to support SFM, create an enabling environment for forest investment, and combat and eradicate illegal practices, as well as promote secure land tenure. Scenario analysis The soil erosion rates of the baseline scenarios were predicted for the reference years 2001 and 2012 without considering conservation cropping and management practices.

Conflicting Data: How Fast Is the World Losing its Forests?

Environmental and economic costs of soil erosion and conservation. And, despite numerous corporate and government promises to the contrary, there is no sign of that figure declining. The on-site costs of soil erosion are thus internalized by pricing them directly into the economic decision making of the land user.

UN/DESA Policy Brief #88: Financing sustainable forest management: a key component of sustainable COVID

In many areas, ensuring that degraded or temporarily deforested areas can regrow may be more effective. The grey colour indicates the areas that were excluded from the modelling due to data unavailability i.

Settlement changes after peak population: Land system projections for China until 2050

Curtis and his coauthors acknowledge shortcomings in their data. Rainfall and soil characteristics were obtained using the best database available to adequately describe their pattern and dynamics during the elaboration of this study. Flow diagram of land use changes and their effects on the soil loss estimates.
