## Biferrocenyl Schiff bases as efficient corrosion inhibitors for an aluminium alloy in HCl solution: a combined experimental and theoretical study

Manganese porphyrins with electronwithdrawing substituents on their phenyl groups are much less effective catalysts than those with electron donating substituents, so that the most efficient system that has been selected involves Mn T 4-CH CH<sub>3</sub> 2P P OAc, which was then used for oxidation of other alcohols. Also our results show that stability of B<sub>2</sub>H<sub>6</sub>-NCCH<sub>3</sub> is slightly greater than B<sub>2</sub>H<sub>6</sub>-NCH complexes.

## In the name of God the Merciful the Compassionate

The reactions were carried out at room temperature and high to excellent yields were obtained. The fabrication of cobalt magnetic nanostructures on n-tridecylamine x hydrochloride TDA x HCl self-assembled monolayer SAM modified silicon surfaces using direct writing atomic force microscope AFM lithography for localized electrochemical reduction of cobalt ions was demonstrated.
