## What is climate change?

A 2020 paper in the journal found that climate model predictions published between the 1970s and 2010 were accurate when compared with the actual warming that occurred after publication.

## Joint Global Change Research Institute

Scientists have high confidence that global temperatures will continue to rise for decades to come, largely due to greenhouse gases produced by human activities. They can measure tree rings to get a season-by-season record of temperature and moisture.

## Climate Change

NASA National Snow and Ice Data Center Distributed Active Archive Center. Sea level rise, erosion, inundation, risks to infrastructure and increasing ocean acidity pose major threats.

## Climate change: Latest news and explainers

Tree records are relatively short but incredibly detailed. Net annual costs will increase over time as global temperatures increase. Some models focus on changing the individual as a method of cultural change and some have structures and frameworks to move an entire organization towards focused change and improvement.

## Institute for Global Change

Furthermore, small changes in temperature correspond to enormous changes in the environment. Most resistance occurs due to a fear of the unknown. Rutgers University Global Snow Lab, Accessed September 21, 2018.

## Climate change

The relative contributions of human and natural causes to these increases are still uncertain. The years 2016 and 2020 are tied for the warmest year

on record. But most researchers today prefer the term climate change because of the variability of weather and climate across the globe.
