## Hormones and the Endocrine System

The sympathetic nervous system is involved in preparing the body for stress-related activities; the parasympathetic nervous system is associated with returning the body to routine, day-to-day operations.

## Chapter 45

However, you will not be required to distinguish them. Often, hormones interact with each other, so symptoms of a particular endocrine disorder may be nonspecific.

## Endocrine Function

You will not be required to identify these cell types in electron micrographs, but should note that the cells differ in size, shape and in the number, size and distribution of their secretory granules small black structures in the cytoplasm. Differential Diagnosis in Primary Care, 5th ed.

## 10 Endocrine System Fun Facts

Both hormones prolong and intensify the effects of the sympathetic nervous system.

## Endocrine System

Some of these molecules are even synthesized and employed as chemical regulators, similar to hormones in higher animals, by unicellular animals and plants. Not every specimen in the glass slide sets contain readily identifiable oxyphil cells, but they can be found on each of the virtual slides: slide 217 , slide 220 , and slide 221.

## Chapter 45

Testosterone is an important androgen. What is responsible for giving these cells their characteristic light colored, bubbly cytoplasm? This can be caused by a range of things, including autoimmune conditions.

## **Endocrine Function**

Your best strategy is first to identify acidophils, which are more distinctively stained, and then the remaining cells are almost entirely basophils. Over 50 hormones have been identified in humans and other vertebrates. Human chorionic gonadotropin HCG assists progesterone by signaling the ovaries to maintain the production of estrogen and progesterone throughout pregnancy.

## **The Endocrine System: Function, Organs, Hormones, and Conditions**

Locate nerve endings in contact with the medullary cells.
