Forest Ecosystems in the Alaskan Taiga: A Synthesis of Structure and Function

The importance of fixed effects and p-value adjustments proceeded as described above. We collated site-level data on pre-fire stand structure, stand age, topography, and pre- and post-fire above- and belowground C pools from 417 sites across 18 wildfires. Manipulations of soil water table depth and surface temperature, which were identified from the extensive measurements as being the most important variables in determining the magnitude and direction of net CO₂ exchange, were carried out during the 1993--94 growing seasons in tussock and wet sedge tundra ecosystems.

A wide range of colors can be seen darting through the trees as the forest tops come to life. Two growth forms occur in the Rocky Mountains. Maybe these were all coincidences, but it seemed like rolling dice and always seeing fours or fives come up.
