## Asbestos risk management: Identification, monitoring and removal

Asbestos can split into very fine fibres which can remain airborne for long periods of time after release.

### Management and removal of asbestos

Certain brands of filters may not be usable after being exposed to conditions like a decontamination shower. It will also help make sure that other people do not have their health and safety adversely affected by the work conducted.

### Management and removal of asbestos

A combination of these controls may be required in order to adequately manage and control asbestos or ACM.

### Asbestos Management/Abatement

Friable asbestos means material that is in a powder form or that can be crumbled, pulverised or reduced to a powder by hand pressure when dry, and contains asbestos.

### NC DPH: Occupational and Environmental Epidemiology: Asbestos Hazard Management

The PCBU carrying out the asbestos-related work may provide the decontamination facilities, but the PCBU for which the work is being carried out is still required to make sure they are available.

### Asbestos

Any damage to materials containing asbestos should be reported to the appropriate authority, such as your occupational health and safety professional. It is good practice to ensure that the levels of airborne fibres do not exceed one half of the exposure standard 0. See section 9 of this code for information about asbestos management plans, and Appendix C for suggested content headers for an asbestos management plan.

## **Asbestos risk management: Identification, monitoring and removal**

Two types of licences apply to asbestos removal: Class A and Class B.
