General Facts About Volcanoes

We currently know of 80 or more which are under the oceans. Volcanic ash causes airplane engines to fail, destroys crops, contaminates water, and damages electronics and machinery.

Volcano

Another process is magma mixing between felsic rhyolitic and mafic basaltic magmas in an intermediate reservoir prior to emplacement or lava flow.

Key Facts About Volcanic Eruptions

High-viscosity magma with a high content of dissolved gas produces violent explosive eruptions. The rest of the volcanoes are located throughout the American West, and in Hawaii see our for their locations.

Volcano facts and photos

However, the span of recorded history differs from region to region. All of these activities can pose a hazard to humans.

What Is a Volcano?

The volcanic ash and gas injected into the atmosphere obscured the sun and increased the reflectivity of Earth, cooling its surface and causing what's known as the year without a summer. These volcanoes have been extinct for many millions of years, but the European spacecraft has found evidence that volcanic activity may have occurred on Mars in the recent past as well.
