Small Mammal ID Guide

Its tail is about a third of the length of its body shorter proportionately when compared to the bank vole. This threat is very real: the Mouse-eared Bat was declared extinct from Britain in 1991. If you see a shrew swimming, it is most likely this species! The most characteristic feature is their incredibly fluffy tail.

They are extremely manoeuvrable, even at low speed, which makes them very effective insect predators.

The NHBS Guide to UK Small Mammal Identification

Most of the bats that occur in Britain belong to the family Vespertilionidae, the 'evening bats'; however, we also have two species from the family Rhinolophidae, the Horseshoe Bats, so-called because of a horseshoe-shaped plate of skin around the nostrils.

British Mammals: An Audio Introduction to the Mammals of Britain

They have a characteristic skull shape and dentition.

British Mammals: An Audio Introduction to the Mammals of Britain

Bat species account for about 20% of all mammals.

British Mammals: An Audio Introduction to the Mammals of Britain

Herbivores are usually the easiest to find and watch because they tend to live in colonies, while the carnivores are usually more difficult to spot and many of them are nocturnal. Mostly nocturnal, it eats seeds, shoots, buds, berries, insects and snails.

List of mammals of British Columbia

Generally the most often caught in small mammal surveys.
