The test can be repeated using further samples from the same field population. The composition of claim 13 wherein said walls of said container are made of a material selected from at least one of the group consisting of polyvinyl alcohol, polyethylene oxide and hydroxypropyl methyl cellulose. ## Flowable insecticidal delivery compositions and methods for controlling insect populations in an aquatic environment

Carbon disulphide and hydrogen cyanide HCN were the first chemicals to be used for this type of treatment and HCN remained the primary fumigant for some years. Exposure for only a few hours to concentrations of 100 to 200 ppm may cause severe illness or death. CONFIRMING RESISTANCE The appearance of unaffected insects in a discriminating test could be due to the presence of unusually tolerant individuals from a normal population.

Kenaga 1961 described the use of graphs to estimate the effective use of c x t products of eight different fumigants against *Tribolium confusum* Duv. In foodstuffs such reactions may lead to taint or the formation of poisonous residues.

### **Terrestrial delivery compositions and methods for controlling insect and habitat**

**Desorption** When a treatment is completed and the system is ventilated to remove the fumigant from the space and the material, the fumigant slowly diffuses from the material. Coniferous evergreens are particularly liable to sustain severe damage at this critical stage.

### **Chemistry of Drugs Used against Arthropod Parasites**

The composition can also be used with suitable protective hydrophobic outer layer in a laminate, such as is disclosed in U. Untersuchungen zur Abtötung der Dörrrobstmotte *Plodia interpunctella* und des Brotkäfers *Stegobium paniceum* mit Kälte bei -10°C, -14°C und -18°C.
