Alfred Tarski

The problem of negative sentences has a simple solution in STT because they are true or false under the same definition as positive ones. I stands for the relation of inclusion among these subclasses. Cook argues that strengthened liar reasoning forces us to recognize intermediate truth values that run all the way through the open-ended ordinal numbers.

Tarski's Theory of Definition

Formal Presentation of STT The earlier explanations concerned the simplest case, namely satisfaction of monadic open formulas, that is, of the form $P x$. The other signs mean what you would expect.

Tarski's Theory of Definition

But how to define this function? The Journal of Philosophical Logic 30: 329-54. According to the representational view, our goal in constructing a semantics is to devise a class of models that represents all logically possible ways the world might be that are relevant to the truth or falsity of sentences in the language, and to define a relation of truth in a model that satisfies the following constraint: a sentence ϕ should be true in model A if and only if ϕ would be true if the world were as depicted by A, that is, if A were an accurate model. This article tries to show how the STT of truth is related to these questions, or at least to some of them.
