## An index of ecosystem integrity for Northern Chesapeake Bay

The presence of raw or partially treated sewage on the ground's surface or in adjacent ditches or waterways is prohibited; 2.

### Indicators

The Department of Planning and Budget's Economic Impact Analysis: Summary of the Proposed Amendments to Regulation. When ocean-going freighters discharge ballast water in the Chesapeake Bay, we introduce non-native and sometimes invasive species.

### Modeling drivers of phosphorus loads in Chesapeake Bay tributaries and inferences about long

The following performance requirements related to site conditions vertical separation to limiting features and effluent quality: 1 Sites with less than 18 inches of vertical separation, but at least 12 inches of vertical

separation and six inches of naturally occurring, undisturbed soils, require a minimum of TL-2 effluent; 2 Sites with less than 12 inches vertical separation must apply a minimum of TL-3 effluent with disinfection.

**Vol. 27 Iss. 6 (Fast)**

The primary advantage to VDH is having cogent, enforceable regulations.

**An index of ecosystem integrity for Northern Chesapeake Bay**

Trench bottom hydraulic loading rates shall be reduced from the values in Table 1 when a treatment unit or system is not designed to achieve TL-2 or TL-3. Current versions of the WIP propose an expansion of the nutrient credit exchange program to include offsets from the onsite sewage system sector. To translate reductions specified in the TMDL into changes in the watershed, a TMDL Implementation Plan IP is developed.

**Vol. 27 Iss. 7 (Proposed Regulation)  
12VAC5**

To better support statements of attribution for water-quality trends, structural equation modeling was used to model the causal factors of total phosphorus loads in the Chesapeake Bay watershed. Analyses of water samples collected at these stations are the basis for the discussion and graphic summary fig. The designer shall identify the sampling points.

Nutrient Loadings to Surface Waters:  
Chesapeake Bay Case Study

Thomas C. Malone, Walter Boynton, Tom Horton,  
and Curtis Stevenson

Nutrient pollution poses the greatest of all recognized threats to  
Chesapeake Bay

L. Eugene Cristin, Baltimore Sun, March 22, 1987

The thing that really bothers me is that when people like me grow old, we don't have the memory to remember what the water used to be like, what the condition of the river were. They don't have the memory to call back to mind what it was like when the oysters were plentiful about the soft crab crabs in the clear water across pretty bottoms . . . . I would like to see some kind of book . . . . that can generate the enthusiasm for the Bay that there right and now.

Senator Benno Powell, Baltimore Sun, June 14, 1992

Nutrient inputs that result from human activities often cause aquatic ecosystems to become overfertilized with nutrients and deficient in oxygen, a process referred to as cultural eutrophication. This phenomenon occurs when nutrients enter a body of water and stimulate the growth of algae and other plants—these—in assimilating capacity—resulting in the degradation of water quality. Eutrophication can lead to the death of fish and other aquatic life, and with the causes, consequences, and prevention of eutrophication. Our analysis
