But psychology won him over in college, and at Cornell University he did graduate work with sociologist Glen Elder, who wrote *Children of the Great Depression: Social Change in Life Experience*, a landmark study of how the economic environment influences human development. Study members were assessed at age three, and then at 5, 7, 9, 11, 13, 15, 18, 21, 26, and most recently at age 32.

Dunedin Study data provides evidence that youth mental health issues impact adult physical health

She helped with farm chores and rambled in the woods, collecting arrowheads and catching fireflies, often in the company of her beloved Grandma Macon.

The Dunedin Study

Could genotype play a role in behavior as well, making certain children psychologically resistant to abuse? Previous studies showed that reaching puberty early is especially stressful, and Caspi and Moffitt found that the girls who had the most trouble adjusting to early adolescence were those who had shown behavioral problems in early childhood. Childhood abuse seems to erode telomeres—the caps at the end of chromosomes, associated with cell preservation—and that, in turn, may accelerate aging. *Developmental Psychology*, 42(2), 381-390.

Future assessments are scheduled for age 38, 44 and 50.

Dunedin Multidisciplinary Health

Their young mental health issues included mainly anxiety, depression, and substance use, and also schizophrenia. The idea had come to them on safari in Namibia, where they noted how even in that mosquito-infested region many people did not get malaria, undoubtedly because of a genetic resistance.
