Rip currents: NOAA launches new model to predict hourly probability along U.S. beaches

When we got home I had my son watch your video on how to swim out of rip currents. I felt certain that our family knew of our plight and was getting help, but I wondered what was taking them so long! Strong and concentrated currents often occur in tidal inlets, mouths of estuaries and harbor openings associated with both the incoming flood tide and outgoing ebb tide. Even in weaker rip currents, it can be difficult to stand in place at waist depth against persistent flows and the combination of breaking waves and currents can be disorienting.

Media If a media asset is downloadable, a download button appears in the corner of the media viewer. Channelized rip currents typically range in width from 5 to 100 yards, have depths on the order of 3 to 10 feet or more, and may be spaced anywhere from 50 to 500 yards apart, with greater spacing often occurring for large wave heights. They urged both me and my husband to get on their boards.

What are the 4 types of rip currents?

Swim parallel to the shore and swim back to land at an angle. Once I spotted them off in the distance it seemed to take forever to reach them.

I thank God every day for that surfer. We waded out in waist high water and had fun jumping into the waves, which were larger than usual. My training kicked in and I remember to swim along the shore for a while and then make my way back to shore.
