Supplementary information on winds - Columns 24, 41, 58 and 75 give supplementary wind information. Thus, failure to include the subtropical storms into the climate record examined would introduce an artificial bias into the database Neumann et al. The first step is to choose from the primary variables 1—7 for the 12-h forecast in a forward-selection process.

Data were utilized if initial storm positions were located between 80°E and the date line, south of 45°N, and not within 50 km of land. While such velocities are much less than those of the horizontal winds, updrafts are vital to the existence of the towering convective clouds embedded in the eyewall. Wind reports from ships at sea have become increasingly based on anemometers, and less so on the.

To carry this out, diurnal distributions of landfall time were constructed for tropical cyclones in the sample i. ACKNOWLEDGMENTS The National Center for Atmospheric Research is sponsored by the National Science Foundation. The Atlantic prolific years of 1969 and 1995 During the 30-yr period 1966 to 1995, the NAT experienced two prolific years: 1969 and 1995.

. Variations in tropospheric vertical shear and African easterly wave intensity have been hypothesized as the physical mechanisms that link the two phenomena Landsea and Gray 1992 , although Goldenberg and Shapiro 1996 have demonstrated that changes in the vertical shear probably dominate.

It remains to be seen if operational 5-day forecasts of hurricane track and intensity prove to be useful enough to become a permanent part of the operational TC forecasting package. Nowadays, a is used as a hurricane hunter by the Air Force, while the is used by the for research projects used to better understand and improve hurricane forecasts. Statistical significance was measured using a one-tailed Student's t test and the sample size was adjusted for serial correlation using a 24-h time window.

### **Climate Variability of Tropical Cyclones:**

A simple interpretation of a list of normalized regression coefficients is that the larger the normalized coefficient is, the greater is the individual influence of the predictor on the forecast of the predictand. This method results in a pool of 35 potential predictors from which the best predictor combinations can be selected. Wikimedia list article The following is a list of tropical cyclones by year.
