More particularly, the invention relates to such a polymeric powder wherein very small spherical powder particles are adhered together in aggregates which when stirred in water with mild agitation readily break up and allow the individual particles to disperse. McGinity's current research includes film coating technology, hot melt extrusion, materials science, tablet technology, and modified release drug delivery systems. CAP is insoluble in water, alcohols, hydrocarbons, and chlorinated hydrocarbons but soluble in ketones, ethers, alcohols, esters, and in certain solvent mixtures. Upon stirring, the aggregates break up to free the polymer particles in the form and near the size they had in the original dispersion. To form a stable dispersion it is essential that the polymer particles be no more than about 0.

In this study it was concluded that thicker coatings offer better resistance to frictional forces, and consequently cracks that are introduced into the coating during compression. The present invention relates to a pharmaceutical composition in a solid unit dosage form for oral administration in a human or lower animal comprising: a.

As the water evaporates, usually being aided by the controlled application of heat, the polymer particles coalesce to form a continuous film coating. Eur J Pharm Sci 2002;17:145-51. The majority of chapters are written in a way that it will first introduce the reader into the general concept of the topic under discussion.
