Grazing Naturally

The greatest risk is when sheep eat large amounts of toxic herbage quickly, particularly in autumn or early winter. When it rains much of the stored plant-available nitrogen is washed from the EPS into the surrounding soil. A forest undergoing natural regeneration following agricultural land use is a socio-ecological system in transition Lambin and Meyfroidt.

Natural gain in the grazing lands of southern Australia (Book, 2000) [quizapp.evertonfc.com]

It that in 1788, forests according to the current definition covered about 30% of the country. Across the Brazilian Amazon, natural regeneration increased five-fold over the last three decades, exceeding 150 000 km² in 2012 Aguiar et al.

Biodiversity and vegetation

The E-mail message field is required. In the tropics, intensive agricultural production systems for palm oil, soybeans, sugarcane, pineapples, and other crops require removal of trees from parts of the landscape that hinder mechanized or intensive production, such as flat areas in lowlands, where young patches of natural regeneration are frequently eliminated Sayer et al., Shaver et al.

Grazing management options

One exception is the TerraClass land-use mapping system used in Brazil that classifies secondary forest, pasture with woody regeneration, and regeneration with pasture as distinct categories Almeida et al. The available on the MLA website will help you calculate the appropriate stocking rate and length of paddock rotation.

An image

The FAO definition of forest used does not distinguish between native forests and monoculture plantations composed of exotic species. One of these regions was the tropical Andes, where 5000 km² of woody vegetation regrew over this period Aide et al., associated with a decline in rural

population and out-migration to urban areas. Economic and policy incentives will be needed as economies and markets transition from those driving further degradation of native forests to restoration and enhancement of native forests Boillat et al.
