Washington Double Star Catalog

Baltimore: Johns Hopkins University Press. In addition to these, designations for 271 W. The last significant print catalog, the Sky Catalog 2000, was published over two decades ago and based on information that is even older and is limited to a primary visual magnitude of 7.

List of astronomical catalogues

This catalogue contained the positions and magnitudes of 47,390 stars, out to magnitude 9, and was the most complete catalogue up to that time. Several catalogues exist, of which we'll mention a few.

Double Star Astronomy at the U.S. Naval Observatory

In the case of the Hipparcos Catalogue, the principal parts are provided in both printed and machine-readable form on CDROM. Eventually the gravitational dance of double stars provided the key to the stellar mass luminosity relationship, which in turn unlocked the fundamental principles of stellar evolution.

New general catalogue of double stars within 120° of the North Pole / by Robert Grant Aitken ; in ...

As a result there are, for example, five components with the designation H 48! Although more recent data may be available in the Hipparcos HIP and Tycho-2 TYC catalogues, made using data acquired with the , the HD is still the best single source for magnitudes and spectral type of stars. Both the IDS and the WDS cover the entire sky, and the WDS is intended to contain all known visual double stars for which at least one differential measure has been published. Mason, , accessed on line August 20, 2008.

WDS

Because the WDS, UCAC and other modern system identifiers can be nine or more digits long plus declination sign , most references use the historical catalog label, either in the obsolete 19th century form e.

List of astronomical catalogues

Duplicate Discovery Designations Removed: One of the more difficult issues in dealing with the WDS as a database is the presence of duplicate discovery designations - that is, different systems assigned the same 3-character + 4-digit designation. .

Double star

The WDS Catalog contains positions J2000 , discoverer designations, epochs, position angles, separations, magnitudes, spectral types, proper motions and when available, Durchmusterung numbers and notes for the components of 153987 systems based on 1998772 means. A comparison of the contributions of the different techniques, both in their total number as well as mean and median separation are given.
