It is characterised by its bluish-white translucent appearance.

I. Ganoidei

Flanking the Silurian high ground of Cumberland and Westmorland, and also in the Lammermuir hills and in Flint and Anglesey, a brecciated conglomerate, presenting many of the characters of a glacial deposit in places, has often been classed with the Old Red Sandstone, but in parts, at least, it is more likely to belong to the base of the Carboniferous system. Scots, with corrections and additions in her hand ; dated 1577.

One of them is a Pupa, or elongated Land-snail, so similar to modern forms that it does not merit a generic distinction, and is indeed very near to some existing West Indian species. Firstly, because the so-called flexor sublimis constitutes the mass of the second muscular layer.

Notice de personne Louis Compton (1842

Triassic System

It will also be found that quick pulses are more easily taken than slow ones, because the heart can only be rendered slow by means that make the skin cold and inelastic, or by 1 Physiologie Midicale de la Circulation du Sang. From Eighteen-mile Creek, Lake Erie.
