Aquatic Weed Control

Plankton algae produce the majority of dissolved oxygen in the pond and are essential to fish survival.

However, excessive growths of these plants can have a detrimental effect on a body of water and its inhabitants. It grows best in the spring and tends to die out in the summer. Chemical Control Methods: EPA-approved aquatic herbicides may be used to control weeds in ponds.

Stocking: Most submerged aquatic weeds can be controlled with a stocking rate of 20 to 25 triploid grass carp per acre of vegetation. Different aquatic plants exhibit variable efficiencies for different metals in low-level metal-contaminated water. It is reported to remove trace metals from

aquatic systems.

How To Get Rid of Aquatic Weeds With Aquatic Herbicides

Treat your pond in small sections waiting 10 to 14 days in between treatments to ensure fish have an oxygen-rich environment. Redbelly tilapia feed primarily on submerged vascular plants rather than algae, but most pond managers prefer triploid grass carp for control since grass carp offer multiple year control and are easier to manage. However, these invasive species can survive in many different temperature, light, water, and soil conditions.

Aquatic Weed Control

Prem Chandra Pandey, in , 2020 12. Aquatic harvesting enables plant-choked waterways to be cleared or channels to be cut through dense areas of vegetation to increase water flow or enhance the recreational use of water bodies.
